

## Application

The range of applications of the rotary plug valve BR33 corresponds to the "standard" control valve, but it can also be used for many special applications. This valve is specifically used to regulate the flow of media containing solids in automated industrial installations.

The rotary plug valve is especially useful for the control of flow under conditions with high probability of cavitation and erosion. The BR33 also has high rangeability (200:1), enabling larger control ranges.

With the KV's adjustment, integrated into the associated rotary actuator BR99, it is possible to achieve different opening angles of the rotary plug, leading to larger KV's without the need to exchange plug and seat.

## Features

- » Nominal Diameters from DN25 up to DN300
- » Nominal Pressure from PN10 up to CL300
- » Face-to-Face length as per DIN EN 60534-3-1, 60534-3-2 or ANSI/ISA 75.08
- » Temperature range -40°C up to +250°C (optional +450°C)
- » Leakage Class IV and VI according to DIN EN 60534-4
- » Characteristic: Linear (L); Equal-percentage (P) with positioner
- » Rangeability 200:1
- » Design with Flange ends or Wafer type (Sandwich), TA-Luft, Bearing seal (upgradeable) and Outlet sleeve (upgradeable)
- » Design as per Pressure Equipment Directive 2014/68/EU
- » Conformity CE and EAC
- » Optional certification/confirmation according to ATEX 2014/34/EU, GOST-R (TR), SIL2 (IEC 61508) and AD2000 Merkblatt

## Design and technical Specification

Diameters: DN25; 40; 50; 80; 100; 150; 200; 250; 300

Pressure: PN10; 16; 25; 40 as per DIN EN 1092-1:2013 and DIN EN 1092-2:1999  
ANSI CL150; 300 and DIN EN 1759-1:2005

Flanges as per DIN EN 1759-1:2005 can be assembled with flanges execution per standards ANSI / ASME B16.5 and MSS SP44. They correspond to the standard DIN EN 7005-1:2002 following pressure ranges: CL150 ≙ PN20 and CL300 ≙ PN50

Table 1 Flange Versions

Material	Nominal Pressure	Flange Facing Identification			
		Raised Face	Groove	Recess	Ring-Joint
Carbon Steel Stainless Steel	PN10; 16; 25; 40	B <sup>2)</sup>	D	F	-
	CL150		-	-	J (RTJ)
	CL300		DL (D1 <sup>1)</sup> )	F (F1)	

<sup>1)</sup> only for CL300; <sup>2)</sup> B1 – (Ra = 12,5 mm, concentric surface structure "C"), B2 – (Ra as agreed with the customer); (J) – as per ASME B16.5

NOTE: » Padding of Surface with Stellite: ~ 40HRC

## Features

Due to the one-piece housing all occurring pipeline forces are compensated and have no effect on the torque and there are no additional forces on the seat and plug. Flow velocities minimized by the large volume and favorable aerodynamic housing (no deflection). The preferred flow direction (flow to close) has an added anti-wear property. The construction of the bridge construction ensures a free flow and a free of dead space. The double eccentricity of the bridge reduces the drive torque to a minimum, required for the safe closure of the valve. The plug of the BR33 control valve is a simple rotationally symmetrical part, always identical and therefore easily replaceable. By the double eccentric bearing and the required rotation angle of 60° for control, the BR33 has an almost linear inherent characteristic for maximum and reduced KVs.

## Application ranges:

- » Heating Jacket with 2 or 3 Connections
- » Seat, Plug and Outlet Sleeve in 1.4571 + Stellite at Cavitation or Solids
- » Seat, Plug and Outlet Sleeve in Ceramic (Si3N4) at elevated Solids (e.g. calcium hydroxide)
- » Bearing Seal with O-Rings (VITON or Kalrez) at crystalizing, polymerized media

**NOTE:** At operating temperatures below -10°C\* a notch impact test must be performed according to **AD2000 Merkblatt W10\*\***, in which the lowest temperatures are mentioned in three categories (I, II, III) for the respective usage cases.

\* For low temperature usage a technical review of the manufacturer is required!

\*\* The temperature limits mentioned in AD2000 Merkblatt W10 are purely theoretical values and relate only to the indicated material. Due to the multiplicity of used components - of a control valve - it also requires a separate review of the manufacturer!

Coefficients: FL=0,854; XT=0,6; FD=0,7; xFz=0,58

**NOTE:**

The indicated pressure drops (incl. K factor) refer to the version with **metallic sealing system** and should not exceed 70% of the allowable operating pressure for given nominal pressure, material execution and operating temperature as per Table 4. Theoretical acceptable pressure drops are included. Actual pressure drops with consideration of tolerance of spring manufacture and friction of internal parts of the actuator are lower than those given by 20%. With soft sealing system (**leakage class VI**) and diameter > DN200, an extra safety of 10% is needed.

 Calculation of needed torque with **Leakage Class IV**: 
$$\frac{\Delta p * C + 10 * K}{7,5} = Nm$$

 and needed torque for **Leakage Class VI**: 
$$\frac{\Delta p * C + 10 * (K * 1,65)}{7,5} = Nm$$

# Rotary Control Valve BR33

## The Flexibility:

Adjustment of rotation angle of actuator type BR99 via system of two levers. Lever attached to diaphragm plate always turns by 30°, hence stroke, pressure range and positioner feedback lever position do not change. With change in setting of bearing pin turn angle of crankshaft and also valve shaft changes too, within values 25°, 45°, 60° and 90°. In closed position of valve movement of bearing pin to crankshaft guide at the beginning of lever rotation is parallel, hence closed position of valve is maintained.

Connector, which connects actuator to valve shaft, allows turning of actuator to valve by each 90° and since it is accessible from outside it eliminates the need for actuator or valve disassembly.

function **NC**, Spring close
